• T(n,k) recursively defines central factorial numbers of the second kind (in the context of Knuth and Riordan (see references)). It is defined in mathematica package as CentralFactorialNumber1

$$\begin{cases} T(n,1) &= 1 \\ T(n,n) &= 1 \\ T(n,k) &= T(n-1,k-1) + k^2 T(n-1,k) \end{cases}$$

• T(n,k) is central factorial number defined as CentralFactorialNumber2 in mathematica package

$$T(n,k) = \frac{1}{k!} \sum_{j=0}^{k} {k \choose j} (-1)^{j} \left(\frac{1}{2}k - j\right)^{n}$$
